Dear Primary Engineer,

I have come up with a helpful idea to help minimize the amount of bushfires in Australia. It's a camera that has straps to tie around the trees. It also has a smoke detector along with it to detect fires, if the camera doesn't work. With this idea, bushfires can be minimized gradually. Since September 2019, bushfires have taken over Australia and many have suffered from the result of this. From extinctions of animals to houses, destroyed. This invention may be simple and boring but I believe that so many lives can be saved using it. I have named it 'the SavingW'. The 'W' stands for the world and how it doesn't just save lives in Australia, but also the 'worrying' element of the friends, families and animals you love.

Yours sincerely, Sakura
