

Dear Primary Engineer,

I have invented an Easy, Exclusive, Efficient medical vending machine. It is a useful invention, as it has a wide variety of medicines; from tablet capsule to syrups for children. Everything is properly checked and administered so that people are buying medicine sensibly. But, you can not buy or collect you medication without a prescription from the doctors, or pharmacies.

I came up with this idea by looking at things that were already made and adding my ideas to it. I also discovered there was a loop hole in the medical industry, where the vulnerable (high risk) cannot get the medication; as they cannot go to get them.

**IF YOU WERE AN ENGINEER**  
**WHAT WOULD YOU DO?**

This is perfect for elderly or people with health conditions and they in risk of catching infections, so, you put your prescription (1) in that the (5) doctor has given you. Pay via card (2) cash & coins (3) contactless & apple pay (4). The prescription has a code which medicine you need (5) and it drops it at the exit (6)

**Task 5: Choose your best idea and draw it, use lots of annotation explaining how the parts of your drawing will work.**
